

Yellow springtime flowers

Dandelion

Primrose

Lesser celandine

Gorse

Marsh marigold

Daffodil

Cowslip

Colt's-foot

When the flowers start to bloom in the spring time there are usually not many insects about so they have to compete with each other to be pollinated. In particular pollen beetles are attracted to yellow, because it's a sign of food to them.

Woodlands are particularly brightened with flowers in the spring as the plants take advantage of the sunlight reaching the woodland floor before the tree canopy shades them out.
